

Shallow Flooding Analysis

Sheet Runoff Flooding in Zone A Areas

1

Sheetflow Flooding Methodology
based on

Guidelines and Specifications
for
Flood Hazard Mapping Partners

*Appendix E: Guidance for Shallow
Flooding Analyses and Mapping*

http://www.fema.gov/pdf/fhm/frm_gsae.pdf

2

3

Guidelines and Specifications for Flood Hazard Mapping Partners

“The general guidelines cited herein are applicable to all areas of shallow flooding. They are indicative of the general approach taken to the study of shallow flooding problems in order to fulfill the requirements of the NFIP.”

Appendix E – Section E.5

4

Shallow Flooding Types

- ❖ Sheet Runoff
- ❖ Ponding

5

Sheet runoff is the broad, relatively unconfined down slope movement of water across sloping terrain. Like an AO Zone, these areas have flood depths less than 3 feet.

6

Sheet Runoff Sources

Channel Losses Definition

7

Sheet Runoff Sources

Perched Channel Overflow

8

Hydraulic Models

One Dimensional :

- ❖ HEC-RAS
- ❖ HEC-2
- ❖ Quick-2

Two Dimensional:

- ❖ MIKE FLOOD (DHI)
- ❖ RMA (Corps)
- ❖ FLO-2D (O'Brien)

9

2-D models can be very costly because of the amount of data and analysis required.

10

Guidelines and Specifications for Flood Hazard Mapping Partners

“Two-dimensional models will be used where one-dimensional models, currently accepted techniques, and engineering judgment will not provide satisfactory information for floodplain management and NFIP purposes.”

[Appendix C – Section C.3.4.2]

11

Guidelines and Specifications for Flood Hazard Mapping Partners

“Sheet runoff typically takes place across broad areas of low relief. This makes it likely that sheet runoff depths will be less than 1.0 foot.”

Appendix E – Section E.5.3

12

Shallow Flooding Restrictions

- ❖ Analysis is based on Zone A Boundary

13

14

Zone A Flood Boundaries

15

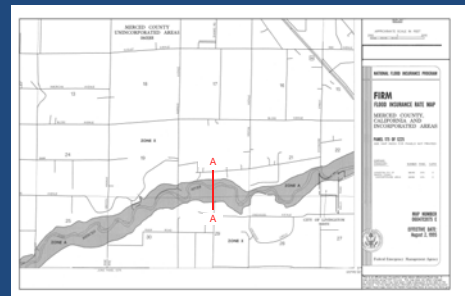

Shallow Flooding Restrictions

- ❖ Analysis is based on Zone A Boundary
- ❖ Average floodplains less than 3 foot depth
- ❖ Known or easily identified hydrology
- ❖ Shallow areas not extensions of riverine systems

16

17

Cross-Section A - A

18

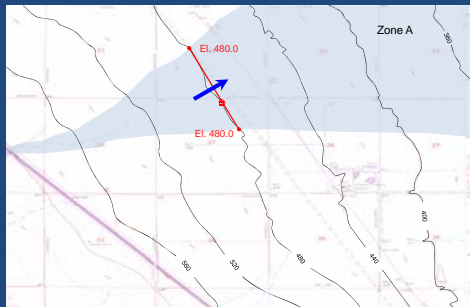

Shallow Flooding Restrictions

- ❖ Analysis is based on Zone A Boundary
- ❖ Average floodplains less than 3 foot depth
- ❖ Known or easily identified hydrology
- ❖ Shallow areas not extensions of riverine systems
- ❖ Unconfined flooding patterns generally perpendicular to contours

20

Sheet Runoff Pattern

Flow Perpendicular to Contours

Shallow Flooding Restrictions

- ❖ Analysis is based on Zone A Boundary
- ❖ Average floodplains less than 3 foot depth
- ❖ Known or easily identified hydrology
- ❖ Shallow areas not extensions of riverine systems
- ❖ Unconfined flooding patterns generally perpendicular to contours
- ❖ Minimal impact from obstructions

22

Variable Flooding Patterns

Flows have a highly unpredictable flow direction due to low relief or shifting of channels and debris loads. The flows will likely concentrate in certain areas and the entire area defined by the Zone A will likely not always be flooded.

24

Guidelines and Specifications for Flood Hazard Mapping Partners

“Shallow flooding is often characterized by highly unpredictable flow direction because of low relief or shifting channels and debris loads. Where such conditions exist, the Mapping Partner shall delineate the entire area susceptible to this unpredictable flow as an area of equal risk.”

Appendix E – Section E.5

25

26

Shallow Flooding Methodology

- ❖ Map and Field Verification
- ❖ Cross-section Development
- ❖ Normal Depth Analysis

27

Map and Field Verification Verify Zone A Mapping

- ❖ Plot Zone A Boundary on Contour Map
- ❖ Flood patterns should be downslope and roughly perpendicular to contours

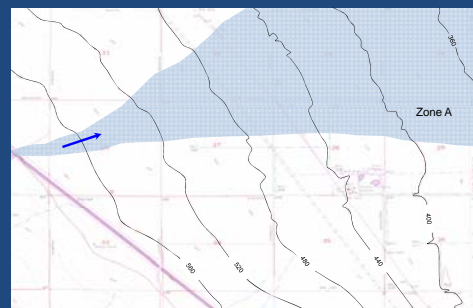

28

When verifying the Zone A boundary, a quadrangle map should be sufficient if nothing else is suitable.

29

Sheet Runoff Flow Pattern

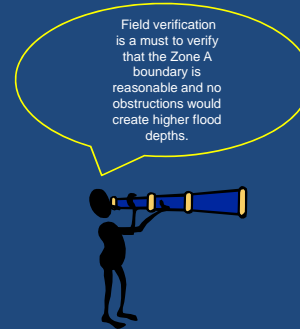

30

Map and Field Verification Field Check Floodplain Boundary

- ❖ Floodplain appears reasonable
- ❖ Raised roads or levees
- ❖ Large structures
- ❖ Large-scale topographic variations

31

32

Zone A Boundary Modification

33

34

Cross-Section Development

- ❖ Topographic Mapping
- ❖ 3 Cross-sections Preferred
- ❖ Cross-Section Location and Spacing

35

36

Cross-Section Development

37

The three cross-sections should include: one through the structure, one upstream, and one downstream. Cross-section spacing should be about half of the floodplain width.

38

Normal Depth Analysis

Manning's Equation

$$Q = \frac{1.486}{n} * A * R^{2/3} * S^{1/2}$$

$$R = \frac{\text{Area}}{\text{Wetted Perimeter}} = \frac{W * D}{W + 2D} \approx D$$

$$Q = \frac{1.486}{n} * W * D * D^{2/3} * S^{1/2}$$

39

Manning's equation can be simplified for sheet flooding since the hydraulic radius is approximately equal to the depth.

40

Normal Depth Analysis

Simplified Manning's Equation

$$D = \left[\frac{Q * n}{1.486 * W * S^{1/2}} \right]^{3/5}$$

D = Depth of flow

Q = Quantity of flow

n = Roughness value

W = Width of flow

S = Slope of floodplain topography

41

Manning's n-value*

Type of Channel and Description	Minimum	Normal	Maximum
D. NATURAL STREAMS			
D-1. Minor streams (top width at flood stage < 100 ft)			
a. Streams on plain			
1. Clean, straight, full stage, no rifts, or deep pools	0.025	0.030	0.033
2. Same as above, but more stones and weeds	0.030	0.035	0.040
3. Clean, winding, some pools and shoals	0.033	0.040	0.045
D-2. Floodplains			
c. Brush			
1. Scatter brush, heavy weeds	0.035	0.050	0.070
2. Light brush and trees, in winter	0.035	0.050	0.060
3. Light brush and trees, in summer	0.040	0.060	0.080
4. Medium to dense brush, in winter	0.045	0.070	0.110
5. Medium to dense brush, in summer	0.070	0.100	0.160

* Partial table taken from FEMA 265 Handbook, Appendix 5, pA5-1 to A5-5

42

In general, roughness in overbank areas is much higher than in channels due to the fact that the shallower flows will be obstructed much more from average height vegetation. Conservative values should be used.

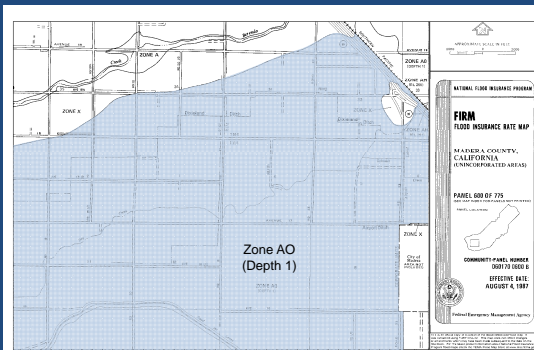

43

Shallow Flooding Hydraulic Guidelines

- ❖ Limited to average flooding depths

44

Standard Depth in AO Areas

Like AO Zones, once you get the average depth for each section, the depths should be averaged into one standard depth for the entire area—though changes in depth can be identified at obvious topographic changes.

46

Shallow Flooding Hydraulic Guidelines

- ❖ Limited to average flooding depths
- ❖ Reasonable velocities
- ❖ Ground contour slopes
- ❖ Cross-section spacing

47

- Average flooding depths limited to 3 feet.
- Reasonable shallow flooding velocities should be between 1 and 5 fps.
- Shallow flooding ground contours should have a slope less than 2% (to prevent confined floods and create conditions not reasonable for sheet flooding methods).
- Cross-sections should be spaced closer together when floodplain widths vary significantly.

48

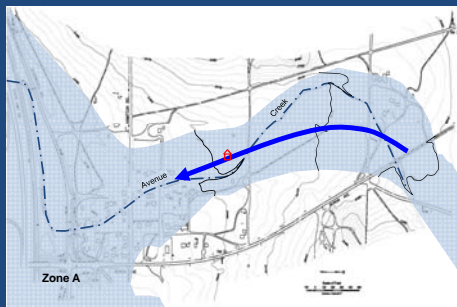

Sheetflow Runoff Examples

49

Avenue Creek

50

Avenue Creek

51

Avenue Creek Normal Depth Analysis

$$D_{\text{Structure}} = \left[\frac{Q * n}{1.486 * W * S^{1/2}} \right]^{3/5}$$

$$Q_{100} = 1720 \text{ cfs}$$

n-value =

Width =

Slope =

52

Avenue Creek Normal Depth Analysis

$$D_{\text{Structure}} = \left[\frac{Q * n}{1.486 * W * S^{1/2}} \right]^{3/5}$$

n-value = 0.16

Width =

Slope =

53

Maximum n-values were used since the medium to dense brush is high compared to the flooding.

54

Avenue Creek Normal Depth Analysis

$$D_{\text{Structure}} = \left[\frac{Q * n}{1.486 * W * S^{1/2}} \right]^{3/5}$$

Width = 600 feet

Slope =

55

Avenue Creek Normal Depth Analysis

$$D_{\text{Structure}} = \left[\frac{Q * n}{1.486 * W * S^{1/2}} \right]^{3/5}$$

$$\text{Slope} = \frac{2470 - 2460}{1800} = 0.00556$$

56

57

Avenue Creek Normal Depth Analysis

$$D_{\text{Structure}} = \left[\frac{Q * n}{1.486 * W * S^{1/2}} \right]^{3/5}$$

$$D_{\text{structure}} = \left[\frac{1,720 * 0.16}{1.486 * 600 * 0.00556^{1/2}} \right]^{3/5} = 2.35 \text{ feet}$$

$$\text{Velocity} = Q / A = 1,720 / (600 * 2.35) = 1.2 \text{ fps}$$

Average Floodplain Depth = 2 feet
(3 cross-sections)

58

Branch Creek

59

60

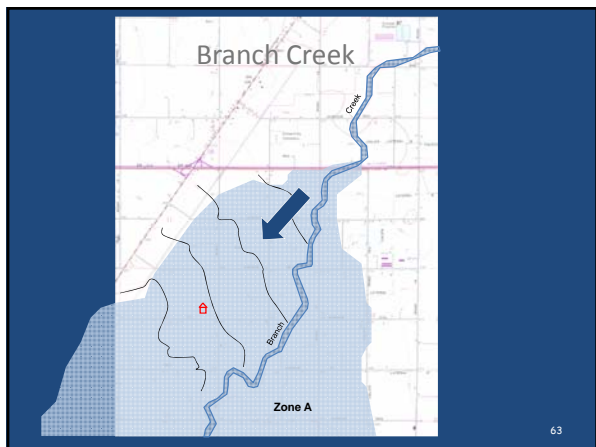

61

This example involves two complexities: a channel that has significant capacity and levees that are overtopped or fail.

62

63

The worse case scenario for water overtopping the levee or levee failure is that the overflow will go west towards the proposed structure.

64

Branch Creek Normal Depth Analysis

$$D_{\text{Structure}} = \left[\frac{Q * n}{1.486 * W * S^{1/2}} \right]^{3/5}$$

$Q_{\text{overland}} =$

$n\text{-value} =$

$\text{Width} =$

$\text{Slope} =$

65

Branch Creek Normal Depth Analysis

$$D_{\text{Structure}} = \left[\frac{Q * n}{1.486 * W * S^{1/2}} \right]^{3/5}$$

$$Q_{\text{overland}} = Q_{100} - Q_{\text{channel}} = 15,000 - 5,000 = 10,000 \text{ cfs}$$

66

Since the channel has a significant capacity, the flow capacity of the channel (with levees at ground level) will be removed from the Q_{100} .

67

Branch Creek Normal Depth Analysis

$$D_{\text{Structure}} = \left[\frac{Q * n}{1.486 * W * S^{1/2}} \right]^{3/5}$$

n-value = 0.05

Width =

Slope =

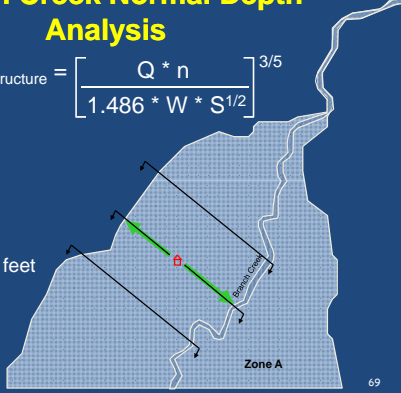

68

Branch Creek Normal Depth Analysis

$$D_{\text{Structure}} = \left[\frac{Q * n}{1.486 * W * S^{1/2}} \right]^{3/5}$$

Width = 7500 feet

Slope =

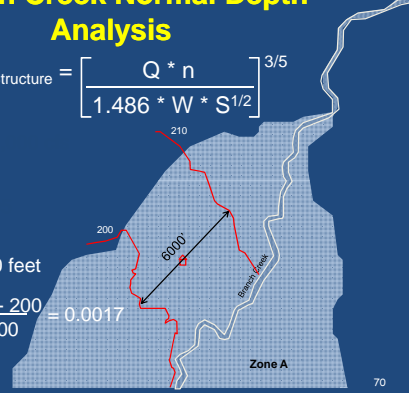

69

Branch Creek Normal Depth Analysis

$$D_{\text{Structure}} = \left[\frac{Q * n}{1.486 * W * S^{1/2}} \right]^{3/5}$$

Width = 7500 feet

Slope = $\frac{210 - 200}{6000} = 0.0017$

70

Branch Creek Normal Depth Analysis

$$D_{\text{Structure}} = \left[\frac{Q * n}{1.486 * W * S^{1/2}} \right]^{3/5}$$

$$D_{\text{structure}} = \left[\frac{10,000 * 0.05}{1.486 * 7,500 * 0.0014^{1/2}} \right]^{3/5} = 1.05 \text{ feet}$$

Velocity = $Q / A = 10,000 / (7,500 * 1.05) = 1.27 \text{ fps}$

Average Floodplain Depth = 1 foot
(3 cross-sections)

71

Cherry Creek

72

Cherry Creek

73

Cherry creek floodplain does not follow the downslope of the contours or expand as a normal unconfined flooding due to the raised Cherry Avenue.

74

Typical Floodplain Characteristics

75

76

Ponding along Cherry Avenue could be greater than 3 feet and cause the shallow flooding analysis to be inadequate for structures close to the road.

77

Cherry Creek

78
